

# GutterMelt Gutters & Downspouts Cheat Sheet DIY Guide

## Tools:

1. Tape Measure
2. Calculator

## Step 1: Measure

1. Measure the total Gutter length (GL): \_\_\_\_\_ ft
2. Measure the Downspout height (DH): \_\_\_\_\_ ft
3. Count the total Downspouts (TD): \_\_\_\_\_ ft

## Step 2: Calculate the length

**Recommended** - 2 runs in Gutters & Downspouts:

$$(GL * 2) + ((DH * 2) * TD) = \text{Total Length (TL)} \text{ _____ ft}$$

**Economical** - 1 run in Gutters & 2 runs in Downspouts:

$$(GL) + ((DH * 2) * TD) = \text{Total Length (TL)} \text{ _____ ft}$$

## Step 3: Voltage

GutterMelt is 120V or 240V: (V) \_\_\_\_\_ VAC

## Step 4: Circuits

### BREAKER SIZING AND MAX CIRCUIT LENGTH

120 Volt Breaker Sizing vs Max Circuit Length (ft)

		15A	20A	30A	40A
12GM1 If started at	40°F	115	150	180	—
	0°F	70	95	145	180
	-20°F	60	85	120	165

240 Volt Breaker Sizing vs Max Circuit Length (ft)

		15A	20A	30A	40A
12GM2 If started at	40°F	230	305	360	—
	0°F	150	200	300	360
	-20°F	130	175	260	360

Using the breaker sizing and max circuit length chart above, the Total Length (TL) from Step 2, your Voltage (V) from Step 3, and your decided breaker size, decide how many circuits you will have by dividing Total Length (TL) by the length under the correct breaker size on the chart. Typically the 40 degree startup is used to calculate max circuit length.

**Total Circuits (TC)** \_\_\_\_\_

## STEP 5: Number of Separated Areas

To decide the number of power connection kits for the system we need two factors, Total Circuits (TC) and Total Areas (TA)

**Total Areas (TA)** are counted as gutters that are essentially separated and do not make a continuous run such as gutters on the front of a building and gutters on the back of a building that do not meet anywhere. For multiple gutter areas, you will need to make a connection at each area, so it is a good idea to draw a measured layout of the different gutters and downspouts around the building so you can take into account the circuits needed as well as the separated gutters for ordering power connection kits.

**Total Areas (TA):** \_\_\_\_\_

## STEP 6: Power Connection Kits (includes End Seal)

The easiest way to estimate this without a layout is to add:

**Total Circuits (TC) + Total Areas (TA) = \_\_\_\_\_ Power Connect Kits (PCK)**

## STEP 7: Downspout Hangar Kits (for 3 wires)

To determine how many downspout hangar kits needed:

**$((TD * 2) / 3) = (DK) \text{ Downspout Kits}$**

## STEP 8: Choose an Activation Device

**Activation Devices** are a great way to save energy and make your system only run when it is needed. Although these cables self regulate and decrease output when the temperature rises, that doesn't stop them from running all winter and summer if you forget to cut the power. There are several activation devices to choose from on our website. Also, many of these activators have a 30AMP switching capacity and for large jobs with more than one circuit a Relay Panel is a great way to activate all of them at the same time with just one activation device. For simple solutions we have plug in cord sets with built in GFCI that also acts as a power connection for a plug and play solution.

## STEP 9: Specs & Parts List for RadiantShop.com

\_\_\_\_\_ (TL) ft of GutterMelt SR Cable  
\_\_\_\_\_ (V) Voltage Required  
\_\_\_\_\_ (PCK) Power Connect Kits  
\_\_\_\_\_ (DK) Downspout Hangar Kits
